## Notes

The safety guard shall always be mounted using two SHS3 at least! See max. load. If the risk assessment of the machine permits a single-channel monitoring a blank hinge can used as bearing element.
High forces, unfavourable force application as well as dynamic loads can shorten the service life.
In case that the SHS3 is used at an ambient temperature of $70^{\circ}$ an accelerated ageing of the connecting cable can occur.
The connecting cable shall be protected against mechanical damages.
The installation of the connecting cable can be done via pipes or cable ducts.
The manufacturer / supplier of the machine / equipment is obliged to take the applicable standards for the calculation of the safety distances of separating safety guards to hazardous areas into account.
Especially these standards apply: DIN EN 349, DIN EN 953, DIN EN ISO 14119, DIN EN ISO 13857, ... .
The switch shall not be used as a mechanical stop.
